

— POWER AND SITING

**Texas paused new
data center
hookups, and the
federal forecast
moved in eight
days**

SWIPE ►

— WHAT HAPPENED

August 3: the state hit pause

Governor Abbott directed the Public Utility Commission of Texas and ERCOT to audit data center projects in the interconnection queue before any more advance.

— THE SCALE

474 GW of requests, roughly 90 percent data centers

That queue is more than five times the record peak demand ERCOT has ever served, which is why the audit is expected to run into December.

— WHAT IT MOVED

August 11: the federal forecast fell from 14 to 6 percent

The EIA cut its 2027 Texas load growth forecast by eight points and named the pause as the reason. A federal statistical agency moving that fast is the citable part of this story.

Power, water, and public consent are the real constraints

Capital and land are not what gate these projects now. If your firm is chasing data center work, the interconnection queue and the permitting politics belong in your go or no go math.
