

— PRACTICE

**Write a prompt the
way you write a
scope of work**

SWIPE ►

— NAME THE DELIVERABLE

State what you actually want back

A scope names the drawing, the report, the submittal. A prompt should name the exact output too, not just the topic.

— SET THE STANDARD

Give it the standard to meet

You would cite the code edition or the spec section in a scope. Tell the tool which format, tone, or template to follow the same way.

— STATE THE EXCLUSIONS

Say what is explicitly out

A good scope lists exclusions so nobody assumes. A good prompt does the same, so the tool does not wander into work you did not ask for.

— A E C E N T R I C

You already know how to do this

Prompting is not a new skill. It is scope writing applied to a different kind of deliverable.

Full breakdown at the link in bio.
