

— METHOD

**Hours saved is the
wrong metric for
an AI pilot**

SWIPE ►

— THE PROBLEM

Hours saved is self-reported

Nobody logs an honest before and after. The number that survives to the report is the flattering one, not the true one.

— TRACK THIS INSTEAD

Cycle time on a real deliverable

Time a submittal response, a proposal, or a design package from start to finish. It comes from the project record, not memory.

— WHY IT WORKS

It shows up where it matters

Cycle time moves fee and schedule, and a client feels a faster turnaround long before anyone mentions AI.

Pick one deliverable and time it

Measure it before the pilot starts and again after. That comparison is the only pilot result worth reporting.
