

— WORKFORCE

**The grunt work
was the training**

SWIPE ►

— OLD MODEL

Judgment used to come from repetition

Juniors built pattern recognition by manually checking hundreds of beam sizes, redlining drawings, and running the same calc over and over until the numbers started to feel right or wrong before the answer even printed.

— WHAT CHANGES

AI removes the reps, not the need for judgment

When a tool hands over the answer in seconds, a junior sees the output but skips the struggle of getting it wrong first, and that struggle is where judgment actually gets built.

Don't ban it, redesign what juniors are exposed to

The fix isn't keeping AI away from junior staff, it's making them defend, break, and rebuild what the tool produces so they still earn the judgment that used to come free with the grunt work.

Train judgment on purpose, or lose it by accident

Firms that let AI quietly absorb entry level work without changing how juniors are taught will spend the next decade wondering why fewer people are ready to stamp a drawing.
