**The real AI risk in
AEC isn't job loss.
It's job skipping.**

SWIPE ►

— WHAT'S ACTUALLY HAPPENING

AI is absorbing the work juniors used to cut their teeth on

Redlines, first pass QC, quantity takeoffs, and code checks are exactly the reps that taught early career engineers how to spot problems before they became senior reviewers.

— THE TIMELINE

The apprenticeship math doesn't work if the reps disappear

Most firms plan on roughly five to seven years of hands-on review work before an engineer is ready to run drawings solo, and that clock doesn't reset just because AI does the first pass faster.

— OUR CALL

Firms optimizing for speed this year will feel a reviewer shortage in three to five years

Retirements among licensed reviewers are already accelerating, and the pipeline meant to replace them is quietly being thinned out by the same tools making this year's projects faster.

— A E C E N T R I C

Design the training loop before you scale the shortcut

We help firms build AI workflows that speed up delivery without quietly cutting junior engineers out of the reps that make them senior reviewers.
