

— AI STRATEGY

Why we tell most firms to skip the AEC-specific AI tool

SWIPE ►

— THE PITCH

Every AI vendor says it was built for construction

The sales pitch is always the same, that a narrow tool trained on AEC workflows understands your business better than a general model ever could.

— THE REALITY

Most niche tools are a thin layer over the same foundation model

Open the hood on many built for AEC AI products and you will find the same general model underneath, repackaged with a workflow and a markup.

— THE REAL EXCEPTION

Pay for specialization when the asset is data, not the chat window

A tool earns its price when the vendor owns something you cannot replicate, like a regional cost database, a code library, or a live feed into your project data.

Start general, go narrow only where the data justifies it

Our default advice for most firms is to stand up one general-purpose enterprise tool first, build real workflows on it, and only add a specialized point solution once you can name the proprietary asset you are paying for.
